Graphical User Interface vs Command Line

Using graphical user interface is really all I am accustomed to doing up until this point. Although I've done a bit of coding I haven't used command line to search, rename and organize files on my computer without the goal of building a website. This of course meant that it took me some time to figure out how to do very simple tasks especially as I made small spelling errors and didn't know why the command didn't work. It is however something I am very interested in learning more about because I have an interest in user interface design and I know that not everything can be done through a third party.

Graphical User interface on the other hand is something I'm very used to using but in beginning this course I found that I am in desperate need of a better organization system. I currently have a mac laptop but it belongs to the people I worked for on campus at MSU. As I am transferring I will have to give the laptop back and buy one for myself. That means that I am in the process of organizing and moving all my files onto a hard drive so that I can access them when I purchase my own laptop. I was able to do this and practice with both interfaces while getting done what I needed to this week which was quite nice.
